DakotaAccessFacts.com

The Dakota Access Pipeline (DAPL) will transport domestically produced crude oil to American consumers using state-of-the-art underground pipeline technology.

Landowner Protection

We are committed to working with local communities to protect South Dakota's valuable land and water and will fairly compensate landowners for the use of their land.

Agricultural Benefits

DAPL will ease the region's transportation backlog, moving crude by pipeline and freeing railcars and trucks to carry agricultural products more affordably. The project will also provide a critical energy link that will help to produce the fuels and lubricants that Americans depend upon to farm our crops, deliver our commodities to market, and move our families and products across our country.

State-of-the-Art Pipeline Safety Technology

Pipelines are the safest way to transport energy, according to federal statistics, and the Dakota Access Pipeline will employ the most advanced technology and monitoring systems to make it even safer.

Benefits for South Dakota's Economy

DAPL will bring \$189 million in direct payments to landowners, create up to 4,000 construction jobs, and generate \$52 million in tax revenue for South Dakota during construction and the first year of operation alone. DAPL will also increase American energy independence, displacing unreliable foreign oil with domestic energy to fuel the U.S. economy.
