

We are Committed to South Dakota

The Dakota Access pipeline will do more than bring greater energy security and safe transport of domestic crude oil. It will also bring jobs and revenue to local communities.

And we will do it in accordance with all state and federal laws, rules and regulations while employing the industry’s best practices and advanced technologies to protect the valuable land of America’s heartland.

As a part of our promise and continued operations in South Dakota, we are making four core commitments to you:

Local Economic Benefits

The Dakota Access pipeline will create an estimated 2,000-4,000 jobs in South Dakota to build the project, and will generate approximately \$38.5 million of tax revenue during construction and then an estimated \$13.5 million in property taxes once the project goes into service in South Dakota.

Land Protections

We share a commitment to South Dakota’s land and agricultural community. Our promise is to treat all landowners fairly and to be honest and responsive before, during and after construction and throughout operations. We are working with landowners and farmers along the route to protect and restore the long-term productivity and integrity of the land.

Advanced Safety Technologies

Safety is Energy Transfer and Dakota Access Pipeline’s top priority. Our pipeline will be built utilizing state-of-the-art technology and safety procedures that will be monitored 24/7, 365 days a year. We will install pressure and temperature sensors with special regulation devices to monitor pipeline flow along the pipeline route. In addition, emergency shut-off valves are stationed to immediately and safely shutdown pump stations and the pipeline in the case of emergency.

Reliable Energy Supply & Transportation Infrastructure

The Dakota Access Pipeline will create new, safe infrastructure to transport domestically produced oil. And it will provide greater access to the affordable energy that South Dakotans need. The increase in shipment of oil by rail and truck in recent years has left fewer transportation options for agriculture and other industries. Building reliable transportation infrastructure will allow more crude oil to reach U.S. markets safely and efficiently, while alleviating the transportation shortages for agriculture and other industries.
